

Ban Primate Experiments

Every year, thousands of monkeys are used in cruel and senseless experiments. These include drug safety tests for pharmaceutical products, in which the monkeys may be poisoned by being force-fed chemicals. In addition, monkeys are used to study brain disorders such as stroke, Alzheimer's and Parkinson's disease. Other research projects involve deliberate brain-damage and then having electrodes implanted in their heads. This is followed by periods where food and water are denied, while the monkeys are made to perform frustrating, repetitive tasks. Not only do these experiments cause immense suffering, but they are also dangerously misleading for humans, because of the significant biological differences between humans and monkeys.

We the undersigned, call upon the government to ban primate experiments with immediate effect.
